

typingscoretest.com — Project Assessment Report

1. What Was Uploaded

A `dist.zip` file containing **only pre-built production assets** (a Vite build output):

```
dist/
├── assets/
│   ├── index-D2fzr8Lx.css    (3 KB — minified CSS)
│   └── index-q-1j7ydQ.js    (317 KB — minified JS bundle)
├── favicon.svg              (SVG lightning bolt icon)
├── icons.svg                 (SVG icon sprite)
└── index.html                (19 lines, entry point)
```

Total size: ~356 KB

2. Build Output vs. Source Code

This is a build output only — NO source code is available.

- No `package.json`, `vite.config.ts`, `tailwind.config.js`, `tsconfig.json`
 - No `src/` directory, no React components, no unminified code
 - No `next.config.js` — despite earlier mentions of Next.js, this is actually a **Vite + React 19 SPA** (Single Page Application)
 - The JS bundle is fully minified/bundled into a single 317 KB file
-

3. Technology Stack (Detected from Bundle)

Layer	Technology
Bundler	Vite (confirmed by <code>link[rel=modulepreload]</code> handler and <code>/vite.svg</code> favicon ref)
UI Framework	React 19.2.5 (confirmed in bundle)
Animation	Framer Motion (<code>Su.div</code> , <code>AnimatePresence</code> , <code>whileHover</code> , <code>layoutId</code>)
Icons	Lucide React (icon components like <code>Pu</code> , <code>Iu</code> , <code>Lu</code> , <code>Fu</code> , <code>Nu</code>)
Styling	CSS (minified, 3 KB — may use Tailwind but classes are stripped in build)
Routing	None — Single page, no react-router detected

4. Current Content Pages

Only ONE page exists: a Typing Speed Test

The entire site is a single-page typing test app with:

- A header: “Typing Speed Test” / “Master your flow.”
- A typing test area with random words
- Stats display: Time (seconds), WPM (Words Per Minute), Accuracy (%)
- Results screen after test completion
- Footer: “© {year} Typing Speed Test. Built with precision.”

Pages that DO NOT exist:

-  No About page
-  No Privacy Policy page
-  No Terms of Service page
-  No Contact page
-  No blog/guide/article content
-  No “How to improve typing speed” or similar educational content
-  No sitemap.xml
-  No robots.txt
-  No ads.txt

5. AdSense Compliance Issues

Issue: “Google-served ads on screens without publisher-content; Low value content”

Root causes:

1. **Extremely thin content** — The site has literally ONE interactive widget (a typing test) with zero textual/educational content. Google requires substantial, original publisher content on pages where ads are displayed.
2. **No informational pages** — No about, privacy, terms, contact pages. Google expects a legitimate publisher identity.
3. **No ads.txt file** — Google flagged “Not found.” The file `ads.txt` must exist at the domain root (`typingscoretest.com/ads.txt`) with the publisher ID.
4. **Single Page Application** — All content is bundled in JS. Google’s crawler may see an empty `<div id="root"></div>` with no server-side rendered content.

6. What Needs to Be Done

Critical (AdSense Compliance)

#	Task	Details
1	Create ads.txt	<code>google.com,</code> <code>pub-8995675464812587, DIRECT,</code> <code>f08c47fec0942fa0</code> at domain root
2	Add substantial content pages	At minimum: How to Improve Typing Speed guide, Typing Tips & Techniques, What is WPM, About Us, Privacy Policy, Terms of Service, Contact
3	Add AdSense script	Include the AdSense auto-ads script in <code><head></code>
4	SSR or pre-rendering	Google’s crawler needs to see content in the HTML, not just an empty <code><div></code> . Either migrate to Next.js SSR/SSG or use a pre-rendering solution

High Priority (Content & Trust)

#	Task	Details
5	Privacy Policy page	Required for AdSense, GDPR
6	Terms of Service page	Required for legitimacy
7	About Us page	Publisher identity
8	Contact page/section	Publisher reachability
9	Multiple content-rich pages	Blog-style articles about typing, keyboard tips, etc. (minimum 3-5 substantial articles with 500+ words each)

Recommended (SEO & UX)

#	Task	Details
10	Multi-page routing	Convert from SPA to multi-page site or add react-router
11	sitemap.xml	For Google indexing
12	robots.txt	Standard crawl directives
13	Structured data	Schema.org markup for the tool
14	Meta tags per page	Unique title/description for each page

7. Recommendation

Since there is **no source code available** (only a minified build), the project needs to be either:

Option A: Rebuild from source — If Edgar or Clyde have the original source repo, provide it so we can add pages, routing, ads.txt, and content directly.

Option B: Build a new site from scratch — Create a proper multi-page site (Next.js or Vite + React Router) that wraps the typing test widget with substantial content pages, trust pages, and AdSense integration.

Option C: Create the missing assets as static files — Add `ads.txt`, `robots.txt`, `sitemap.xml`, and create standalone HTML content pages that link to the main app. This is the quickest fix but least elegant.

8. Reference: Screenshots vs. Current State

The uploaded screenshots (screen 1-9) show a **completely different site** — “GenerateFancy-Fonts” (generatefancyfonts.com), a fancy font generator. This appears to be a **design reference** that Edgar wants typingscoretest.com to emulate in terms of:

- Navigation structure (Home, How to Use, guides, etc.)
- Footer with multiple link columns (Core Guides, Platform Hub, Legal)
- FAQ section with accordion items
- “How It Works” step-by-step section
- Content-rich sections explaining the tool
- Trust pages (About Us, Privacy Policy, Terms of Service)

The current typingscoretest.com dist has **none of these features**.
